-!- CATALYTIC ACTIVITY: ATP + L-leucine + tRNA (Leu) = AMP +
diphosphate + L-leucyl-tRNA (Leu).
-! GYBJCELLULAR LOCATION: Cytoplasmic.
-! SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + tRNA = S-adenosyl-L-homocysteine + tRNA containing thymine.
-!- SIMILARITY: Belongs to the RNA M5U methyltransferase family. TrmA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14 EKHSFIKKYPKEFYTKDFKLFASKDKHYRTRAELSFYHENDTLFYAMFDPKSKKKYIIEY

Chem. 273:26026-26035(1998).

-!- FUNCTION: Interacts with the cytoplasmic domain of the autophosphorylated insulin receptor which is then inhibited. The interaction is mediated by the SH2 domain.

-!- SUBUNIT: Binds to the ankyrin repeat region of TNKL via its N-terminus (By similarity).

-!- SUBCELLULAR LOCATION: Cytoplasmic, associated with the Golgi and endosomes (By similarity).

-!- PTM: Phosphorylated on serine residues (By similarity).

-!- SIMILARITY: Contains 1 PH domain.
-!- SIMILARITY: Contains 1 SH2 domain.
-!- SIMILARITY: Contains 1 SH2 domain.
-!- SIMILARITY: Belongs to the GRB7/10/14 family.
                                                                                                                                                                                                                                                                                                        15-JUL-1999 (Rel. 38, Created)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
fluorescent protein (GFP) or its analogue. The GFP containing mutations at F64L and E222G has a bigger compared to other GFP's making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity or dephosphorylation activity, or for measuring protein kinase activity or dephosphorylation activity, or for measuring protein cafferibution. The fluorescent protein is useful in studying cellular functions in living cells; as protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity and as a marker for changes in cell morphology, as transfection marker, and as a marker to changes in cell morphology, stransfection marker, and as a marker to be used in combination with fluorescence activated cell sorting (FACS). The novel proteins can also be used as reporters to monitor live or dead biomass of organisms, such as fungi. The fluorescent fusions for performing transposon vector mutagenesis and as a reporter fusions for performing transposons encoding the fluorescent protein are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

The fluorescent protein engineered into the genome of a phage is useful for designing diagnostic tool. The present sequence is a DNA encoding enhanced F64L-E222G jellyfish green fluorescent protein (GFP) mutant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DHYQQNTPIGDGPVLLPDNHYLSTQSALSKDPNEKRDHMVLAGFVTAAGITLGMDELYK 239
                                                                                                                                                       The invention relates to a novel cell, comprising three heterologous conjugates (HC), a first HC (HCI) comprising an anchor protein that specifically binds to an internal structure within the cell conjugated tan interactor protein (TP) of type A, a second HC (HC2) comprising IP of type B conjugated to a first protein of interest, and a third HC (HC3) comprising a second protein of interest conjugated to detectable group. The cell is useful for detecting if a compound disrupts or induces the interaction between two intracellular proteins. The cell is also useful for screening compounds that modulate the interaction between two intracellular proteins. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PDE4; central nervous system; antiinflammatory; cytostatic; nootropic; autoimmune; ischemic; osteopathic; GFP; green fluorescent protein; fusion protein.

The invention relates to determining, if a compound, is a dislocator of PDE4. The method comprises testing if the compound removes PDE4 spots, which may optionally be induced by a Rolipram-like reference compound, and testing if it inhibits the catalytic activity of the PDE4, where the compound is a dislocator of PDE4, if it removes PDE spots and if it does not inhibit the catalytic activity of PDE4. The method is useful for identifying compounds useful for the treatment of diseases of the central nervous system such as depression and for the treatment of inflammatory disease, respiratory diseases, chronic obstructive pulmonary disease.

(COPD), including asthma, chronic bronchitis, pulmonary disease conductoric shock, toxic shock syndrome, systemic lupus erthematosis, postiasis, bone resorption diseases, reperfusion injury, cancer and HIV infection. The use of a reagent that can mimic or reverse the effect of the compound with affinity for the catalytic site on intracellular distribution of the PDE for the preparation of a medicament. The present sequence represents the amino acid sequence of a HSPDE4A1-E22G fusion
                                                                                                                                          Determining if a compound is a dislocator of PDE4 for identifying compounds for treating CNS and inflammatory disease comprises identifying compounds which remove PDE4 spots.

Amino acid sequence of HSPDE4A4-E222G fusion protein. AAG65782 standard; protein; 1132 AA 07-JAN-2002 (first entry) AAG65782; RESULT

PDE4; central nervous system; antiinflammatory; cytostatic; nootropic; autoimmune; ischemic; osteopathic; GFP; green fluorescent protein; fusion protein.

Aequorea victoria. Homo sapiens

WO200179526-A2

Enhanced F64L jellyfish green fluorescent protein mutant.

22-APR-2002 (first entry)

XEXEXEX

AAE17517 standard; protein; 239 AA

```
The invention relates to determining, if a compound, is a dislocator of PDE4. The method comprises testing if the compound removes PDE4 spots, which may optionally be induced by a Rollpram-like reference compound, and testing if it inhibits the catalytic activity of the PDE4, where the compounds useful fit it inhibits the catalytic activity of PDE4. The method is useful for identifying compounds useful for the treatment of diseases of the central nervous system such as. depression and for the treatment of inflammatory disease such as joint inflammation, Crohn's disease, inflammatory bowel disease, respiratory diseases, chronic obstructive pulmonary disease.

(COPD), including asthma, chronic bronchitis, pulmonary emphysema, endotoxic shock, toxic shock syndrome, systemic lupus erthematosis, psoriasis, bone resorption diseases, reperfusion injury, cancer and HIV includiound with affinity for the catalytic site on intracellular distribution of the PDE for the preparation of a medicament. The present sequence represents the amino acid sequence of a HSPDE4A4-E222G fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1014 VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 1073

```
The invention relates to a fluorescent protein derived from green fluorescent protein (GFP) or its analogue. The GFP containing mutations at F64% and E2226 has a bigger compared to other GFP's making it very suitable for high throughput screening due to better resolution. The fluorescent protein is useful in invitro assays for measuring protein kinase activity or dephosphorylation activity, or for measuring protein cedistribution. The fluorescent protein is useful in studying cellular functions in living cells; as protein tags in transgenic animals, living and fixed cells; organelle tags, secretion marker and genetic reporter. The fluorescent protein is also useful as a cell or organelle integrity marker, a marker to be used in combination with fluorescence activated cell sorting (FACS). The novel proteins can also be used as reporters to monitor live or dead biomass of organisms, such as fungi. The fluorescent protein is also useful as markers in transcriptional and translational fusions for performing transposon vector mutagenesis and as a reporter consecut protein is also useful as markers in transcriptional and translational fusions for performing transposons encoding the fluorescent protein are useful for escenting plasmids and chromosomes. The fluorescent protein engineered into the genome of a phage is useful consulational engineered into the genome of a chance for it is also useful as ensured for tagging plasmids and chromosomes. The fluorescent protein engineered into the genome of a phage is useful confident.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel fluorescent protein in in vitro assay for measuring protein kinase activity or dephosphorylation activity, or for measuring protein redistribution, has a green fluorescent protein with F64L and E222G
                                                                                                                                                                                /note= "Wild type Phe substituted with Leu; This corresponds to position 64 in the wild type protein"
Jellyfish; green fluorescent protein; GFP; protein redistribution; cellular function; genetic reporter; mutant; Stoke's shift; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     jellyfish green fluorescent protein (GFP) mutant

```
The invention relates to systems, methods and reagents for cell-based screening or detection of compounds which affect particular biological functions. The methods of the invention utilise fluorescent biodetector concerns. The methods of the invention utilise fluorescent biodetector molecules which, when acted on by a compound of interest, cause an alteration in the cellular distribution of at least the fluorescent concerns. The cytoplasm, but on stress activation translocate to the nucleus. In concern concerns but on stress activation translocate to the nucleus. In canother embodiment biodetector proteins can be used to detect protesse activity. Such protease biodetector fusion proteins comprise one or more fluorescent proteins, a recognition signal which is cleaved by the components may be components of a single protein signal relater two components may be from heterologous sources. Due to the because or may be from heterologous sources. Due to the collular collular localisation signal, the biodetector protein is localised to a particular region of the cell. Once acted on by the protease of interest, the localisation signal, the biodetector protein is localised to a particular region of the cell. Once acted on by the protease of interest, the fluorescent protein is cleaved from the localisation sequence of a second localisation signal attached to the fluorescent protein enables the fluorescent protein of the protease recognition sequence. The compartment after cleavage of the protease recognition can be detected using imaging methods with a high degree of spatial resolution. The methods and
                                                                                                                                                      Biodetector protein; fusion protein; recognition site; cellular targetting sequence; cellular localisation; fluorescent protein; protease activity detection; toxin detection; cellular stress detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Automated cell-based characterization of toxin by contacting cells containing luminescent reporter molecules with test substance and analyzing optically.
                                                                                                            Enhanced green fluorescent protein (EGFP), SEQ ID NO:46.
                                                                                                                                                                                                                          drug discovery; cell based screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 11; Fig 29A; 336pp; English.

biosensors of the invention can be used to investigate a wide range of cellular activities and to screen compounds which modulate these extivities. Biosensors containing a recognition site for caspase, for example, may be used for the screening of compounds which modulate apoptosis, while biosensors containing other protease recognition sites may be used for the detection of proteolytic toxins (such as anthrax lethal factor). The method provides improved target validation and candidate compound optimisation by combining many cell screening formats with fluorescence-based molecular reagents and computer-based feature extraction, data analysis and automation, resulting in increased quantity and speed of data collection and faster evaluation of drug candidates. Sequences AAB22881-B22885 represent fluorescent proteins which may used as components of biosensor fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                               61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

protein based on the Aequorea green fluorescent protein (GFP). The emission intensity changes as pH varies between 5 and 10 of the present protein are novel. The functional engineered fluorescent proteins show reversible changes in fluorescence over physiological pH ranges. They can be used for determining the pH of samples and cells. The polymucleotides can also be used to produce transgenic animals. The polymucleotides pH sensors can be delivered to cells in the form of polymucleotides encoding the protein sensor fused to a targeting signal. The targeting signal incots the expression of the protein sensors to restricted cell locations. This makes it possible to measure the pH of a precisely defined cellular region or organelle
                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                          The present sequence is that of the EGFP signal domain, which can be included in novel recombinant protease biosensors (PBS) of the invention. The present segments a farst domain (see AAY79579-87) comprising at least 1 detectable polypeptide signal such as the present sequence; a second domain (see AAY79588-622) comprising at least 1 protease recognition site; and a third domain (see AAY7963-37) comprising at least 1 reactant target sequence. A recombinant nucleic acid (see AAA27627-43) encoding the PB, an expression vector, and a cand (see AAA27627-43) encoding the PB, an expression vector, and a candentically engineered host cell are also claimed. A claimed method for identifying compounds that modify protease activity in a cell involves contacting a host cell that possesses the recombinant PB with a test compound, and determining the PB distribution in the host cell, where changes in the distribution of the PB are correlated with modification of protease activity by the test compound. Claimed kits for identifying compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the compounds that modify protease activity in a host cell include the host call include the compounds that modify protease activity in a host cell include the host call include the compounds that modify protease activity in a lost cell include the compounds that incleic acid, or the recombinant PB, or the vector, or the host cell. The PB is useful in high content screens to detect in vivo activity to a claim of activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activity by activ

The present sequence is a fluorescnet protein used in the construction of a fluorescent protein indicator. The indicator comprises a sensor polypeptide that is responsive to a chemical, biological, electrical or physpiological parameter, and a fluorescence protein functional group. The sensor polypeptide is operatively inserted into the fluorescent moiety. The fluorescent indicator is useful for detecting the presence of a response inducing member in a sample. The method involves contacting the sample with the indicator and detecting a change in fluorescence, in which a change is indicative of the effect of the parameter on the sensor polypeptide. The novel fluorescent proteins are advantageous due to their transfer)-based sensors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                 The invention provides melanin concentrating hormone (MCH) receptor (MCHR) chimeric and fusion proteins. The MCHR chimeric proteins comprise MCHR polypeptide regions from different species. The MCHR fusion protein comprise MCHR polypeptide region and a fluorescent polypeptide region joined directly, or via a linker, to the carboxy side of the MCHR polypeptide region. The MCHR fusion proteins can be expressed by standard recombinant methodology. MCH action promotes feeding (orexigenic) and up regulation of MCH activity stimulates food intake. The present sequence represents a A. victoria green fluorescent protein (GFP) and a linker

```
death rate of a micro-organism within a predetermined time period in a desired environment. The method comprises introducing at least two reporter genes encoding luminescent and/or fluorescent products into the micro-organisms, incubating the micro-organism within the desired environment, and detecting luminescence and/or fluorescence after a predetermined time period. Use of two different markers within a micro-organism enables the differentiation between growth and death rates. The method is used to assess the growth rate and death rate of a micro-organism within a predetermined time period in a dealred environment. The present sequence represents a green fluorescent protein (GFP), and is encoded by a plasmid which encodes luminescent and fluorescent proteins, and is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

                                                                                                                                                                                                                                                                                                                                                                                         VNRIELKGIDFKEDGNILGHKLEYNYNSHNVYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180
                                                                                                                                The invention relates to a gene encoding proteins having cyan-green fluorescence characteristic and having a function of showing stable fluorescence characteristic in acid region. A method for the preparation of a cyan-green fluorescent protein is provided which involves a transformant transformed by a recombinant vector comprising the gene, where the transformed by a recombinant vector comprising the gene, culture. The present sequence represents the A. victoria green fluorescent protein (EGFP)
                                                                                                                                                                                                                                                                                       09

The invention describes methods of automated detection, classification
and identification comprising treating cells containing luminescent
creporter molecules (I) in array of locations with a test substance, where
(I) are detectors, classifiers or identifiers, imaging cells in each
clocation to obtain luminescent signals and converting optical information
into digital data to interpret presence of toxins in the test substance.
The method are useful for detection of toxins chosen from proteases, ADP-
ribosylating toxins, cytotoxic phospholipases, and exfoliative toxins.
Three classes of cell-based luminescent reporter molecules such as
detectors, classifiers and identifiers are described and serve as
reporters of toxic threat agents. The first two levels of
characterisation ensure a rapid readout of toxin class without
sacrificing the ability to detect many new mutant toxins or dissect
several complex mixtures of known toxins. This is the amino acid sequence
of a protease biosensor related signal sequence used in the cell-based
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 LVTTLSYGVQCFSRYPDHMKQHDFFKSAMPEGYVQERTIFFKDDGNYKTRAEVKFEGDTL 120

mutation and a phosphorylated 5'-terminus are annealed to a template DNA mutation and a phosphorylated 5'-terminus are annealed to a template DNA and then subjected to an elongation reaction using a thermostable high-fidelity DNA polymerase, after which the phosphorylated 5'-terminus and then subjected terminus are ligated by means of a thermostable DNA ligase the elongated terminus are ligated by means of a thermostable DNA ligase to synthesise a circular DNA containing the primers, a digestion in which the step of DNA synthesis is repeated several fines to amplify the DNA containing the primers and then, at least DNAs other than the amplified circular DNA are digested into several fragments obtained in the step of DNA synthesis in which, with the several fragments obtained in the step of digestion as megaprimers, the megaprimers are annealed to the circular DNA synthesised above, followed by an elongation reaction performed using the thermostable high-fidelity DNA polymerase. The method is useful for mutagenesis, particularly for introducing centain mutations at certain sites of the nucleotide sequence. The present method is simple, speedy, economical and widely applicable. The present sequence is Aequorea victoria enhanced green fluorescent protein (SGFP) used for mutagenesis in an exemplification of the invention. The EGFP is derived by a latering the green fluorescent protein (GFP) sequence of Aequorea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VNRIELKGIDFKEDGNILGHKLEYNYNSHNYYIMADKQKNGIKVNFKIRHNIEDGSVQLA 180

The phosphoaminoacid binding domain, (PAABD) and an acceptor molecule. The phosphorylation indicators of the invention are useful for detecting kinases or phosphatases in a biological sample. They are also useful in high throughput analysis e.g. for detecting a kinase inhibitor or phosphatase inhibitor. The present sequence is Aequorea victoria enhanced green fluorescent protein (EGFP) used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

Patent No. 6518021
GENERAL INFORMATION:
APPLICANT: Ole THASTRUP, et al.
APPLICANT: Ole THASTRUP, et al.
TITLE OF INVENTION: A Method For Extracting Quantitative Information Relating To An ITILE OF INVENTION: On A Cellular Response
FILE REFERENCE: 3759-0110P
CURRENT APPLICATION NUMBER: US/09/417,197
CURRENT FILING DATE: 1999-10-07
NUMBER OF SEQ ID NOS: 143
SOFTWARE: Patentin version 3.0
SEQ ID NO 127
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

GENERAL INFORMATION:

APPLICANT: Bernard R. TERRY et al.

TITLE OF INVENTION: Live cell procedures to identify compounds modulating intracellul?

TITLE OF INVENTION: distribution of phosphodiesterase (PDE) enzymes

FILE REFRENCE: 3759-0125P

CURRENT APPLICATION NUMBER: US/10/257,909A

CURRENT FILING DATE: 2002-10-17

NUMBER OF SEQ ID NOS: 36

SOFTWARE: FastSEQ for Windows Version 3.0

SEQ ID NO 30

LENGTH: 893
